

FQ17000046

How do you determine the output method of a report within a procedure?

-

In order to determine how a user displayed a document there is a variable which can be used which is called :SENDOPTION , this variable stores the option which the user chose when printing the procedure.

For example if you wanted to update the flag only if the document had actually been printed and not mailed then you would do:

```
UPDATE INVOICE
SET FLAG = 'Y'
WHERE :SENDOPTION = 'PRINT' ;
```

Other options are `MAIL` for mail
`AMAIL` for Automatic email
`EXCEL` for Excel
`WORD` for Word
